

The development of MROADS is focus onto tackling the road safety issues, by using historic and current road accident data to better understand the problem and the situation of road safety. Road accident data used to be kept for record keeping only, but with the development of intelligence system such as MROADS has made it possible to use the data to guide stakeholders and researchers in understanding the problem of road safety thus will help them to better formulate interventions and initiatives that can solve road safety issues and problems thus reducing the number of road fatalities and accidents.
